Today's Topics

- Role of Compiler
- Role of Operating System
 - Loading of program for execution
 - Creation of Process
 - Code, data, Heap, Stack areas of memory accessible to a process
- Compiling HLL programs into Machine Code
- Libraries and how they are linked with your code
- Linking: Static vs Dynamic Linking
- Coverage from Chapter # 1 and Chapter # 2 of Textbook
 - Assembly Language for x86 Processors 7th Edition (available on Slate)

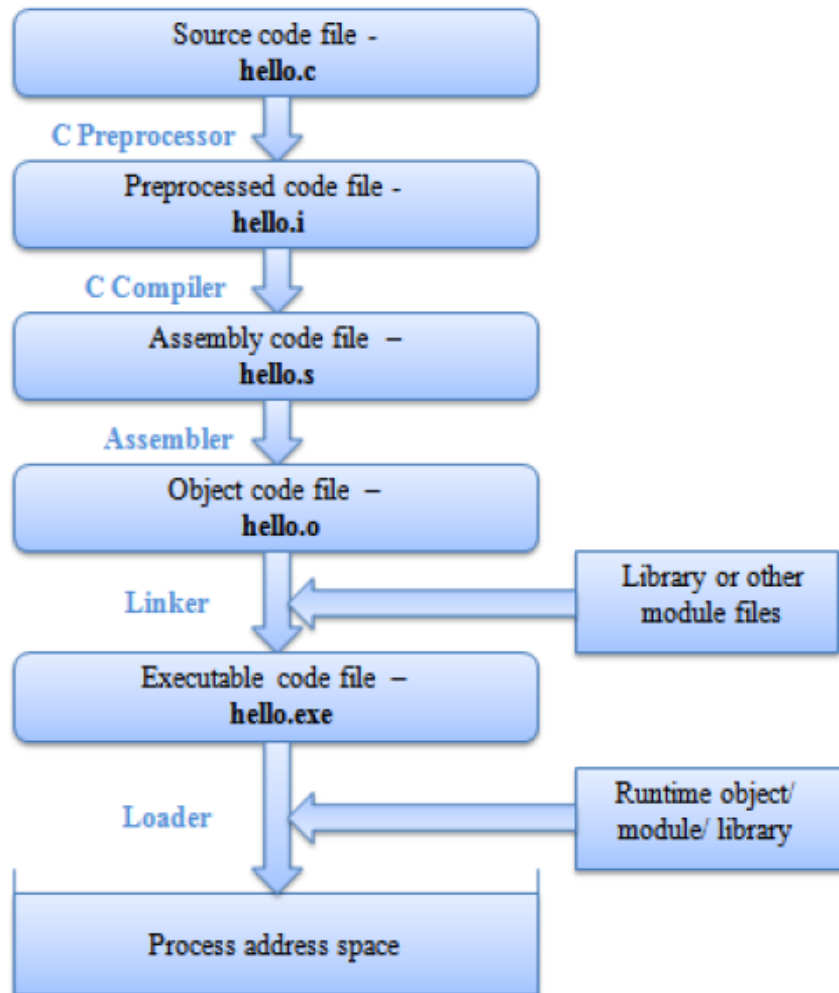

Role of Compiler

- Compiler converts high-level code into machine code (stored in .exe file) which will be executed by the processor (a complex digital circuit).
- There could be many different ways to design digital circuits. How compiler knows about the processor?
- So, there is a unique compiler for each processor. (Why?)
- Compiler read each high-level language statement and break the computation in each statement in terms of operations on data. For example, $c = a + b$ means that there are three variable (memory locations) a, b, c and contents of a and b are added together and stored in c.
- Therefore, compiler generated code is for a specific processor. The code contains hundred of operations in specific order. The operations are in binary and act as a instruction to the processor.
- Therefore, the processor is suppose to read each instruction and execute it step-by-step and store the results internally or in memory.

Role of Operating System

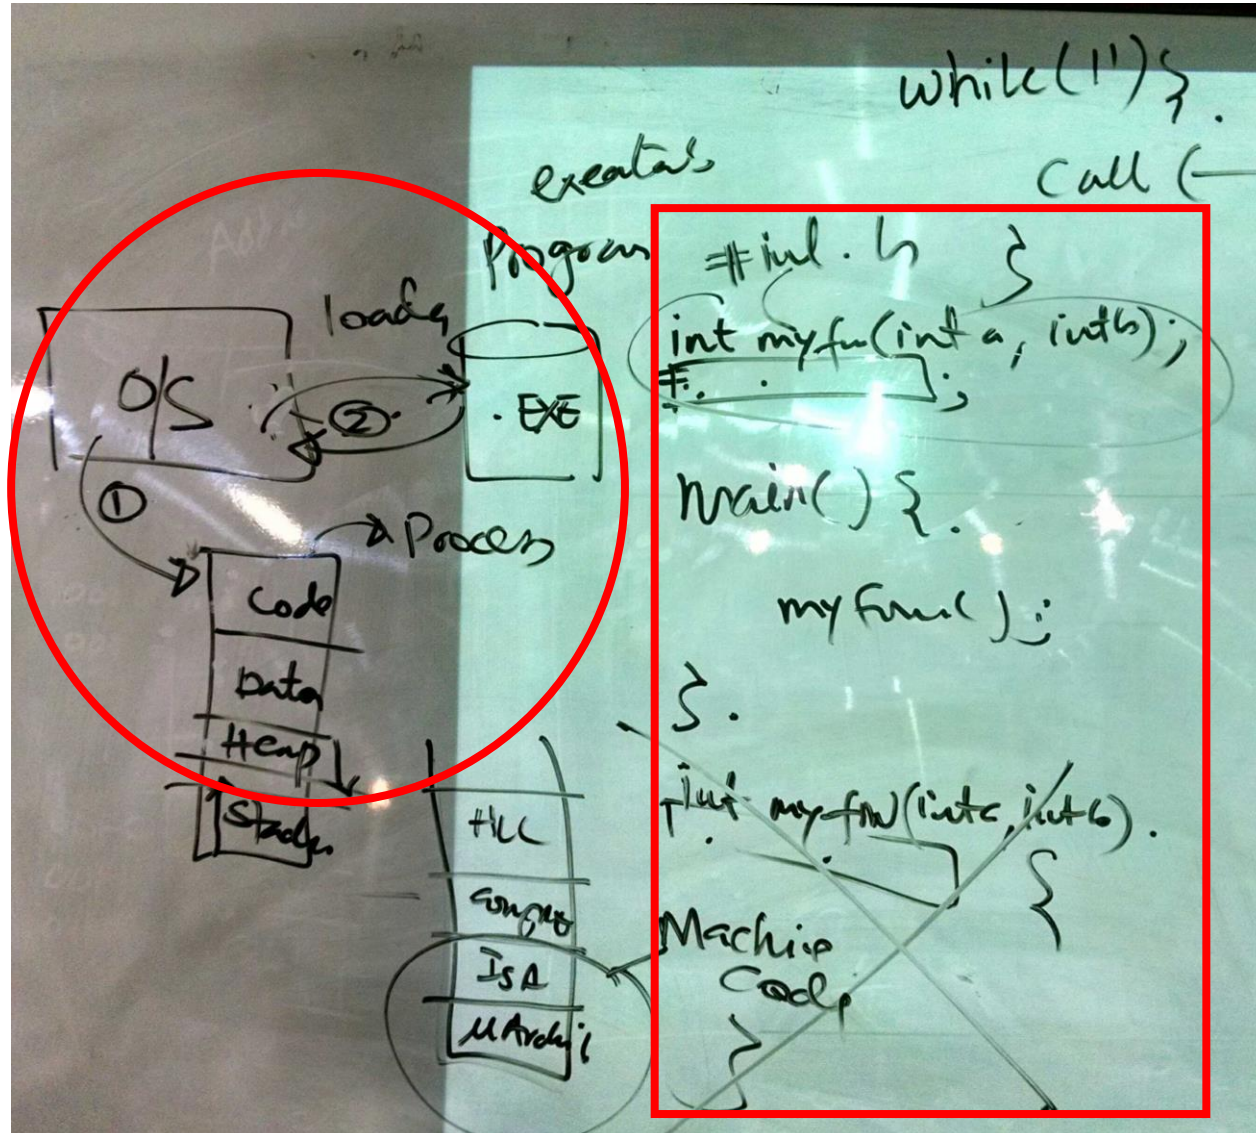

- Compiler makes executable file on disk.
- Operating System (OS) reads code from disk and load it into memory.
- OS later create a process to execute the program on the processor.
- Processor (e.g. Intel Core i7, AMD, IBM, NVIDIA) executes code in memory by reading inputs: keyboard or data files on disk, etc. and generating outputs: Display, Ports (network, printer, etc.), disk, or other connected devices.
- Therefore, OS give users a user-friendly computing environment where multiple programs execute together facilitating the computer user.
- However, in this course, we are interested in understanding:
 - (40%) How internal digital circuits of a processor are organized to execute machine-code? (No circuit diagrams only block diagram of processor organization)
 - (60%) How processor perform execution steps using the internal organization when it executes each machine code instruction?

Compiling HLL programs into Machine Code

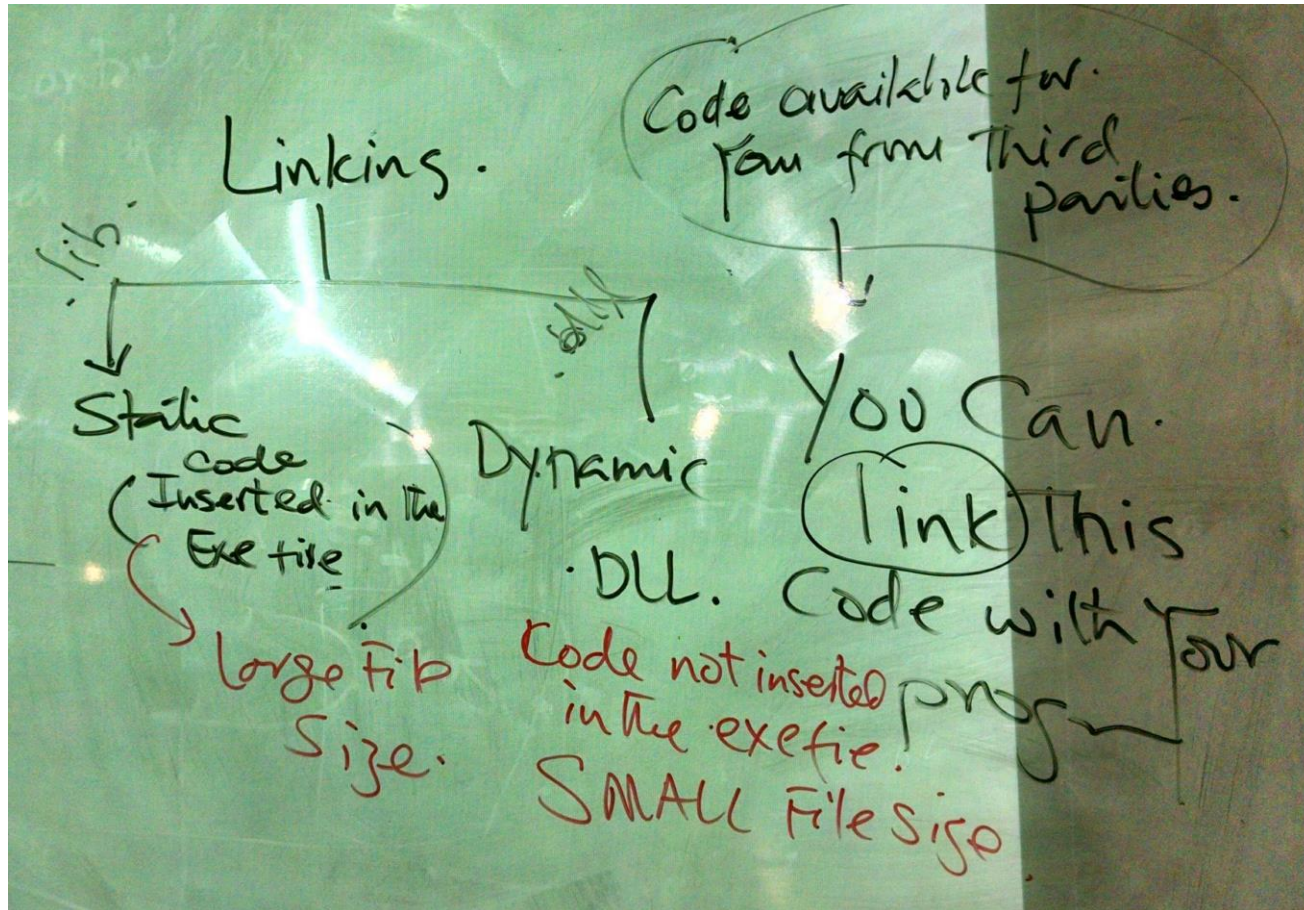

- Object code files contain unresolved reference to external functions which are in libraries.
- The linker takes all object code files search given libraries to get executable code and create a unified executable (.EXE) file.

Libraries and how they are linked with your code

- How OS create a process and load the executable program from the file system.
- Header files included in your program to supply the definitions and declarations you need to invoke system calls and libraries.
- See textbook chapter # 2 for more details.

Linking: Static vs Dynamic Linking

- Linking can be static linking (compile type) or dynamic linking (runtime using dynamic link libraries)
- Libraries contain executable code where the coder doesn't want to reveal the source code. However, you can link executable code into your program.

BASIC CONCEPTS

1.3 Data Representation

- 1.3.1 Binary Integers
- 1.3.2 Binary Addition
- 1.3.3 Integer Storage Sizes
- 1.3.4 Hexadecimal Integers
- 1.3.5 Hexadecimal Addition
- 1.3.6 Signed Binary Integers

- 1.3.7 Binary Subtraction
- 1.3.8 Character Storage
- 1.3.9 Section Review

1.5 Chapter Summary

1.6 Key Terms

1.7 Review Questions and Exercises

- 1.7.1 Short Answer
- 1.7.2 Algorithm Workbench

x86 PROCESSOR ARCHITECTURE

Self reading. Ask
question in class.

- 2.1 General Concepts
 - 2.1.1 Basic Microcomputer Design
 - 2.1.2 Instruction Execution Cycle
 - 2.1.3 Reading from Memory
 - 2.1.4 Loading and Executing a Program
 - 2.1.5 Section Review
- 2.2 32-Bit x86 Processors
 - 2.2.1 Modes of Operation
 - 2.2.2 Basic Execution Environment
 - 2.2.3 x86 Memory Management
 - 2.2.4 Section Review

- 2.4 Components of a Typical x86 Computer
 - 2.4.1 Motherboard
 - 2.4.2 Memory
 - 2.4.3 Section Review
- 2.5 Input-Output System
 - 2.5.1 Levels of I/O Access
 - 2.5.2 Section Review
- 2.6 Chapter Summary
- 2.7 Key Terms
- 2.8 Review Questions
